Using the on-screen MENU function, select the LTR (long-term reset) setting under SHUTTER. Check with the camera manual for additional information. Frame scan rate is determined by the period of the TTL external trigger. The external trigger is input on the Genesis via the analog video input connector trigger pin. Once an external trigger is received, the Genesis generates a TTL EXPOSURE1 pulse which in turn initiates the camera exposure. In this mode, exposure time is determined by the width of the active level of the EXPOSURE1 (Trigger) signal. The default exposure time for this DCF is 17ms, however exposure time can be adjusted using either Matrox Intellicam, Genesis Native Library's imCamControl() or MIL's MdigControl() functions. Refer to the respective manual for additional information.
